

- **Preface**
- **Chapter 1. Introduction**
 - 1.1 The optimum experimental design problem in context
 - 1.2 A general review of the literature
- **Chapter 2. Key ideas of identification and experimental design**
 - 2.1 System description
 - 2.2 Parameter identification
 - 2.3 Measurement-location problem
 - 2.4 Main impediments
 - 2.4.1 High dimensionality of the multimodal optimization problem
 - 2.4.2 Loss of the underlying properties of the estimator for finite horizons of observation
 - 2.4.3 Sensor clusterization
 - 2.4.4 Dependence of the solution on the parameters to be identified
 - 2.5 Deterministic interpretation of the FIM
 - 2.6 Calculation of sensitivity coefficients
 - 2.6.1 Finite-difference method
 - 2.6.2 Direct-differentiation method
 - 2.6.3 Adjoint method
 - 2.7 A final introductory note
- **Chapter 3. Locally optimal designs for stationary sensors**
 - 3.1 Linear-in-parameters lumped models
 - 3.1.1 Problem statement
 - 3.1.2 Characterization of the solutions
 - 3.1.3 Algorithms
 - 3.1.3.1 Sequential numerical design algorithms with selection of support points
 - 3.1.3.2 Sequential numerical design algorithms with support points given a priori
 - 3.2 Construction of minimax designs
 - 3.3 Continuous designs in measurement optimization
 - 3.4 Clusterization-free designs
 - 3.5 Nonlinear programming approach
 - 3.6 A critical note on a deterministic approach
 - 3.7 Modifications required by other settings
 - 3.7.1 Discrete-time measurements
 - 3.7.2 Multiresponse systems and inaccessibility of state measurements
 - 3.7.3 Simplifications for static DPSs
 - 3.8 Summary 100
- **Chapter 4. Locally optimal strategies for scanning and moving observations**
 - 4.1 Optimal activation policies for scanning sensors
 - 4.1.1 Exchange scheme based on clusterization-free designs
 - 4.1.1.1 Conversion to the problem of finding optimal sensor densities
 - 4.1.1.2 Characterization of optimal designs
 - 4.1.1.3 Numerical procedure of the exchange type
 - 4.1.2 Scanning sensor scheduling as a constrained optimal control problem
 - 4.1.2.1 Optimal sensor scheduling problem
 - 4.1.3 Equivalent Mayer formulation
 - 4.1.4 Computational procedure based on the control parameterization-enhancing technique
 - 4.2 Adapting the idea of continuous designs for moving sensors
 - 4.2.1 Optimal time-dependent measures
 - 4.2.2 Parameterization of sensor trajectories

- 4.3 Optimization of sensor trajectories based on optimal-control techniques
 - 4.3.1 Statement of the problem and notation
 - 4.3.1.1 Equations of sensor motion
 - 4.3.1.2 Induced pathwise state inequality constraints
 - 4.3.1.3 Optimal measurement problem
 - 4.3.2 Equivalent Mayer problem and existence results
 - 4.3.3 Linearization of the optimal-control problem
 - 4.3.4 A numerical technique for solving the optimal measurement problem
 - 4.3.5 Special cases
 - 4.3.5.1 Optimal planning of sensor movements along given paths
 - 4.3.5.2 Measurement optimization with minimax criteria
 - 4.3.5.3 Minimal number of sensors
- 4.4 Concluding remarks
- **Chapter 5. Measurement strategies with alternative design objectives**
 - 5.1 Optimal sensor location for prediction
 - 5.1.1 Problem formulation
 - 5.1.2 Optimal-control formulation
 - 5.1.3 Minimization algorithm
 - 5.2 Sensor location for model discrimination
 - 5.2.1 Competing models of a given distributed system
 - 5.2.2 Theoretical problem setup
 - 5.2.3 T_{12} -optimality conditions
 - 5.2.4 Numerical construction of T_{12} -optimum designs
 - 5.3 Conclusions
- **Chapter 6. Robust designs for sensor location**
 - 6.1 Sequential designs
 - 6.2 Optimal designs in the average sense
 - 6.2.1 Problem statement
 - 6.2.2 Stochastic-approximation algorithms
 - 6.3 Optimal designs in the minimax sense
 - 6.3.1 Problem statement and characterization
 - 6.3.2 Numerical techniques for exact designs
 - 6.4 Robust sensor location using randomized algorithms
 - 6.4.1 A glance at complexity theory
 - 6.4.2 NP-hard problems in control-system design
 - 6.4.3 Weakened definitions of minima
 - 6.4.4 Randomized algorithm for sensor placement
 - 6.5 Concluding remarks
- **Chapter 7. Towards even more challenging problems**
 - 7.1 Measurement strategies in the presence of correlated observations
 - 7.1.1 Exchange algorithm for Ψ -optimum designs
 - 7.2 Maximization of an observability measure
 - 7.2.1 Observability in a quantitative sense
 - 7.2.2 Scanning problem for optimal observability
 - 7.2.3 Conversion to finding optimal sensor densities
 - 7.3 Summary
- **Chapter 8. Applications from engineering**
 - 8.1 Electrolytic reactor
 - 8.1.1 Optimization of experimental effort
 - 8.1.2 Clusterization-free designs
 - 8.2 Calibration of smog-prediction models
 - 8.3 Monitoring of groundwater resources quality
 - 8.4 Diffusion process with correlated observational errors
 - 8.5 Vibrating H-shaped membrane
- **Chapter 9. Conclusions and future research directions**

- **Appendix A. List of symbols**
- **Appendix B. Mathematical background**
 - B.1 Matrix algebra
 - B.2 Symmetric, nonnegative definite and positive-definite matrices
 - B.3 Vector and matrix differentiation
 - B.4 Convex sets and convex functions
 - B.5 Convexity and differentiability of common optimality criteria
 - B.6 Differentiability of spectral functions
 - B.7 Monotonicity of common design criteria
 - B.8 Integration with respect to probability measures
 - B.9 Projection onto the canonical simplex
 - B.10 Conditional probability and conditional expectation
 - B.11 Some accessory inequalities from statistical learning theory
 - B.11.1 Hoeffding's inequality
 - B.11.2 Estimating the minima of functions
- **Appendix C. Statistical properties of estimators**
 - C.1 Best linear unbiased estimators in a stochastic-process setting
 - C.2 Best linear unbiased estimators in a partially uncorrelated framework
- **Appendix D. Analysis of the largest eigenvalue**
 - D.1 Directional differentiability
 - D.1.1 Case of the single largest eigenvalue
 - D.1.2 Case of the repeated largest eigenvalue
 - D.1.3 Smooth approximation to the largest eigenvalue
- **Appendix E. Differentiation of nonlinear operators**
 - E.1 Gateaux and Frechet derivatives
 - E.2 Chain rule of differentiation
 - E.3 Partial derivatives
 - E.4 One-dimensional domains
 - E.5 Second derivatives
 - E.6 Functionals on Hilbert spaces
 - E.7 Directional derivatives
 - E.8 Differentiability of max functions
- **Appendix F. Accessory results for PDEs**
 - F.1 Green formulae
 - F.2 Differentiability w.r.t. parameters
- **Appendix G. Interpolation of tabulated sensitivity coefficients**
 - G.1 Cubic spline interpolation for functions of one variable
 - G.2 Tricubic spline interpolation
- **Appendix H. Differentials of Section 4.3.3**
 - H.1 Derivation of formula (4.126)
 - H.2 Derivation of formula (4.129)
- **Appendix I. Solving sensor-location problems using Maple and Matlab**
 - I.1 Optimum experimental effort for a 1D problem
 - I.1.1 Forming the system of sensitivity equations
 - I.1.2 Solving the sensitivity equations
 - I.1.3 Determining the FIMs associated with individual spatial points
 - I.1.4 Optimizing the design weights
 - I.1.5 Plotting the results
 - I.2 Clusterization-free design for a 2D problem
 - I.2.1 Solving sensitivity equations using the PDE Toolbox
 - I.2.2 Determining potential contributions to the FIM from individual spatial points
 - I.2.3 Iterative optimization of sensor locations
